

HarborGrid Energy

Investor Pitch Deck

01. The thesis

Industrial sites waste clean energy because generation, storage, and demand rarely coordinate in real time.

02. The problem

Factories face volatile power prices, grid congestion, and rising pressure to report Scope 2 emissions. Existing systems monitor consumption but do not orchestrate flexible loads.

03. The solution

HarborGrid is an energy operating system that forecasts site demand, schedules batteries and flexible equipment, and trades verified flexibility with utilities.

04. Product

- Live site and tariff dashboard
- AI load forecast by asset
- Automated battery and equipment dispatch
- Emissions and savings reporting

05. Why now

More intermittent renewables, tighter grid capacity, and cheaper sensors are making flexible commercial demand valuable for the first time.

06. Customer

Mid-market manufacturers, cold-storage operators, and logistics campuses with annual electricity bills above \$500,000.

07. Business model

Annual software subscription priced per site, plus a shared percentage of verified energy savings and grid-services revenue.

08. Go-to-market

Start with energy consultants and battery installers that already manage industrial accounts. Expand from one pilot site to multi-site portfolios.

09. Defensibility

HarborGrid compounds site-level operating data, asset-specific control models, and utility market integrations that improve dispatch outcomes over time.

10. The ask

Raise \$4.5M to complete utility integrations, launch 12 paid pilots, and build the controls team.

****Assumption required:**** pricing and pilot conversion targets require customer validation.
