

CliniLoop

Investor Pitch Deck

01. The thesis

Clinical trial sites lose time to fragmented participant scheduling, resulting in slower studies and unnecessary patient drop-off.

02. The problem

Research coordinators reconcile referrals, eligibility, appointments, and reminders across spreadsheets and disconnected portals. Sponsors see delays but lack a shared operational view.

03. The solution

CliniLoop gives trial teams one workflow for referral intake, eligibility handoff, visit scheduling, and participant communication.

04. Product

- Configurable study workspaces
- Consent-aware participant messaging
- Eligibility and visit task queues
- Sponsor-ready recruitment reporting

05. Why now

More decentralized trials and pressure to shorten study timelines are increasing demand for better site operations without adding coordinator headcount.

06. Customer

Independent research sites and specialty clinic networks running multiple concurrent studies.

07. Business model

Per-study platform fee with usage-based pricing for participant messaging and optional sponsor analytics seats.

08. Go-to-market

Sell through clinical research organizations and site networks. Land with recruitment operations, then expand to study start-up and retention workflows.

09. Defensibility

Study-specific workflow templates, integrations with site systems, and anonymized operational benchmarks create switching costs while keeping patient data controlled by the site.

10. The ask

Raise \$3.2M to validate retention gains across eight studies, complete compliance work, and reach 40 active study workspaces. ****Not provided:**** clinical outcome data.
