

Cascade Works

Investor Pitch Deck

01. The thesis

Modern teams spend too much time turning messy operational data into decisions that arrive after the moment has passed.

02. The problem

Operations leaders pull data from ticketing, inventory, finance, and sensor systems into fragile spreadsheets. Analysts become bottlenecks and frontline teams work from stale information.

03. The solution

Cascade Works turns operational signals into explainable playbooks that recommend the next action and record the result.

04. Product

- Connectors for common operations systems
- Natural-language investigation of live metrics
- Rule-based and learned playbooks
- Approval workflows and outcome tracking

05. Why now

Companies have accumulated cloud data but remain short on operations analysts. AI can help only when recommendations are tied to controlled actions and measurable outcomes.

06. Customer

Multi-site distributors, light manufacturers, and service operators with repeatable exception-handling workflows.

07. Business model

Annual SaaS contract priced by connected site and active playbook, with implementation fees for complex environments.

08. Go-to-market

Start with one high-cost exception such as stockouts or missed service windows. Expand after the first workflow proves measurable savings.

09. Defensibility

Outcome-labeled operational events and customer-specific playbooks create a learning loop that generic chat tools cannot reproduce.

10. The ask

Raise \$6M to expand integrations, establish security certifications, and convert design partners into a repeatable enterprise motion. ****Not provided:**** quantified savings from production customers.
