

Morrow Mobility

Investor Pitch Deck

01. The thesis

Small cities can improve public transport quickly by coordinating the flexible capacity already parked in their communities.

02. The problem

Fixed bus routes are expensive to operate in low-density areas, while residents face long waits and limited evening coverage.

03. The solution

Morrow Mobility orchestrates accessible vans, taxis, and community transport into one demand-responsive network for municipalities.

04. Product

- Rider booking across web, phone, and partner apps
- Accessible dispatch and driver routing
- Municipal service-level dashboard
- Unified fares and concession handling

05. Why now

Cities need lower-emission transport options and better coverage, while existing operators have underused vehicles and drivers during off-peak hours.

06. Customer

Regional transport authorities and municipalities serving 50,000 to 500,000 residents.

07. Business model

Platform fee per service area plus a per-trip coordination fee. Municipal contracts include implementation and support.

08. Go-to-market

Win a corridor or evening service pilot with a transport authority, then expand through existing operator contracts and adjacent service areas.

09. Defensibility

Local demand patterns, accessibility-aware routing, and integrations with concession and dispatch systems improve service quality as networks mature.

10. The ask

Raise \$5.5M to deploy four municipal pilots, complete transit integrations, and establish an operations team. ****Not provided:**** contracted revenue and fleet utilization evidence.
